

CONTROL PANELS

Unlike most other BMS installation companies, Comfort Controls designs and manufactures their own control panels for each and every individual application giving us complete control over time and budgets.

Our control panels are critical to the correct and safe operation of plant and systems. If a panel doesn't work, the BMS doesn't work or at best isn't able to operate as designed. Modifications take time, which delays the entire project, and may have long term quality implications.

Comfort Control panels are designed, manufactured and tested in house and work first time, every time.

Designed using the latest CAD technology by experienced in-house staff who have a thorough understanding of the BMS being used, Comfort Control panels can be relied upon for a smooth, on time installation and long term operation. All of our panels are manufactured using quality components from world leading manufacturers and are thoroughly tested to the current British Standards and regulations before passed for use. We compile comprehensive Operation and Maintenance Manuals for the end user and for our own service department to ensure the continued efficient control of the installed system.

We produce an exceptionally wide range of control panels, from small outstation enclosures to large panels designed to control numerous BMS applications across multiple buildings. We can readily accommodate any request for panel enclosures, such as glass frontage, weatherproofing to a specific rating, choice of material and different colour finishes.

- Exceptionally reliable
- Bespoke design
- Wide range of options
- Manufactured in-house
- Thoroughly tested and demonstrated
- Fully documented for rapid, trouble free installation
